

## *CAPI SNAP Education Series: User Guide*

# *CAPI SNAP Education hls\_memcopy : howto? V2.3*

# Architecture of the SNAP git files

# Action overview

**Purpose:** Transferring data between different resources :

- host memory,
- DDR,
- NVMe (soon)

**When to use it:**

- Understand Basic access to different interfaces
- Memcopy benchmarking

**Memory management:**

- Application is managing address of Host memory and DDR
- Action is testing if size of transfer is greater than DRAM size (see constants)
- Size of buffer (BRAM) used to copy data can be configured (see constants)

**Known limitations:**

- HLS requires transfers to be 64 byte aligned and a size of multiples of 64 bytes
- DDR simulation model reads will return wrong values if non 64 bytes words or non initialized words are read (this is due to the simulation model only)

# Action usage (1/2)

**Usage:** `./snap_memcpy [-h] [-v, --verbose] [-V, --version]`

- `-C, --card <cardno>` can be (0...3)
- `-i, --input <file.bin>` input file.
- `-o, --output <file.bin>` output file.
- `-A, --type-in <CARD_DRAM, HOST_DRAM, ...>.`
- `-a, --addr-in <addr>` address e.g. in CARD\_RAM.
- `-D, --type-out <CARD_DRAM, HOST_DRAM, ...>.`
- `-d, --addr-out <addr>` address e.g. in CARD\_RAM.
- `-s, --size <size>` size of data.
- `-t, --timeout` Timeout in sec to wait for done. (10 sec default)
- `-X, --verify` verify result if possible (only CARD\_DRAM)
- `-N, --no irq` Disable IRQs

## Example :

```
export SNAP_TRACE=0x0
```

```
snap_maint -vv
```

```
echo move 4kB from Host to DDR@0x0 and back from DDR@0x0 to Host
rm t2; dd if=/dev/urandom of=t1 bs=1K count=4
```

```
SNAP_CONFIG=FPGA snap_memcpy -i t1 -D CARD_DRAM -d 0x0
```

```
SNAP_CONFIG=FPGA snap_memcpy -o t2 -A CARD_DRAM -a 0x0 -s0x1000
```

```
diff t1 t2
if diff t1 t2 >/dev/null;then echo "RC=$rc file_diff ok";else
echo -e "$t RC=$rc file_diff is wrong\n$del";exit 1;
fi
```

### Options: (default option in **bold**)

**SNAP\_TRACE** = **0x0** → no debug trace

SNAP\_TRACE = 0xF → full debug trace

**SNAP\_CONFIG** = **FPGA** → hardware execution

SNAP\_CONFIG = CPU → software execution

# Action usage (2/2)

## Different cases that can be run

```
snap_maint -vv -C0
```

```
echo create a 512MB file with random data ...wait...  
rm t2; dd if=/dev/urandom of=t1 bs=1M count=512
```

```
echo READ 512MB from Host - one direction  
snap_memcpy -C0 -i t1  
echo WRITE 512MB to Host - one direction - (t1!=t2 since buffer is 256KB)  
snap_memcpy -C0 -o t2 -s0x2000_0000
```

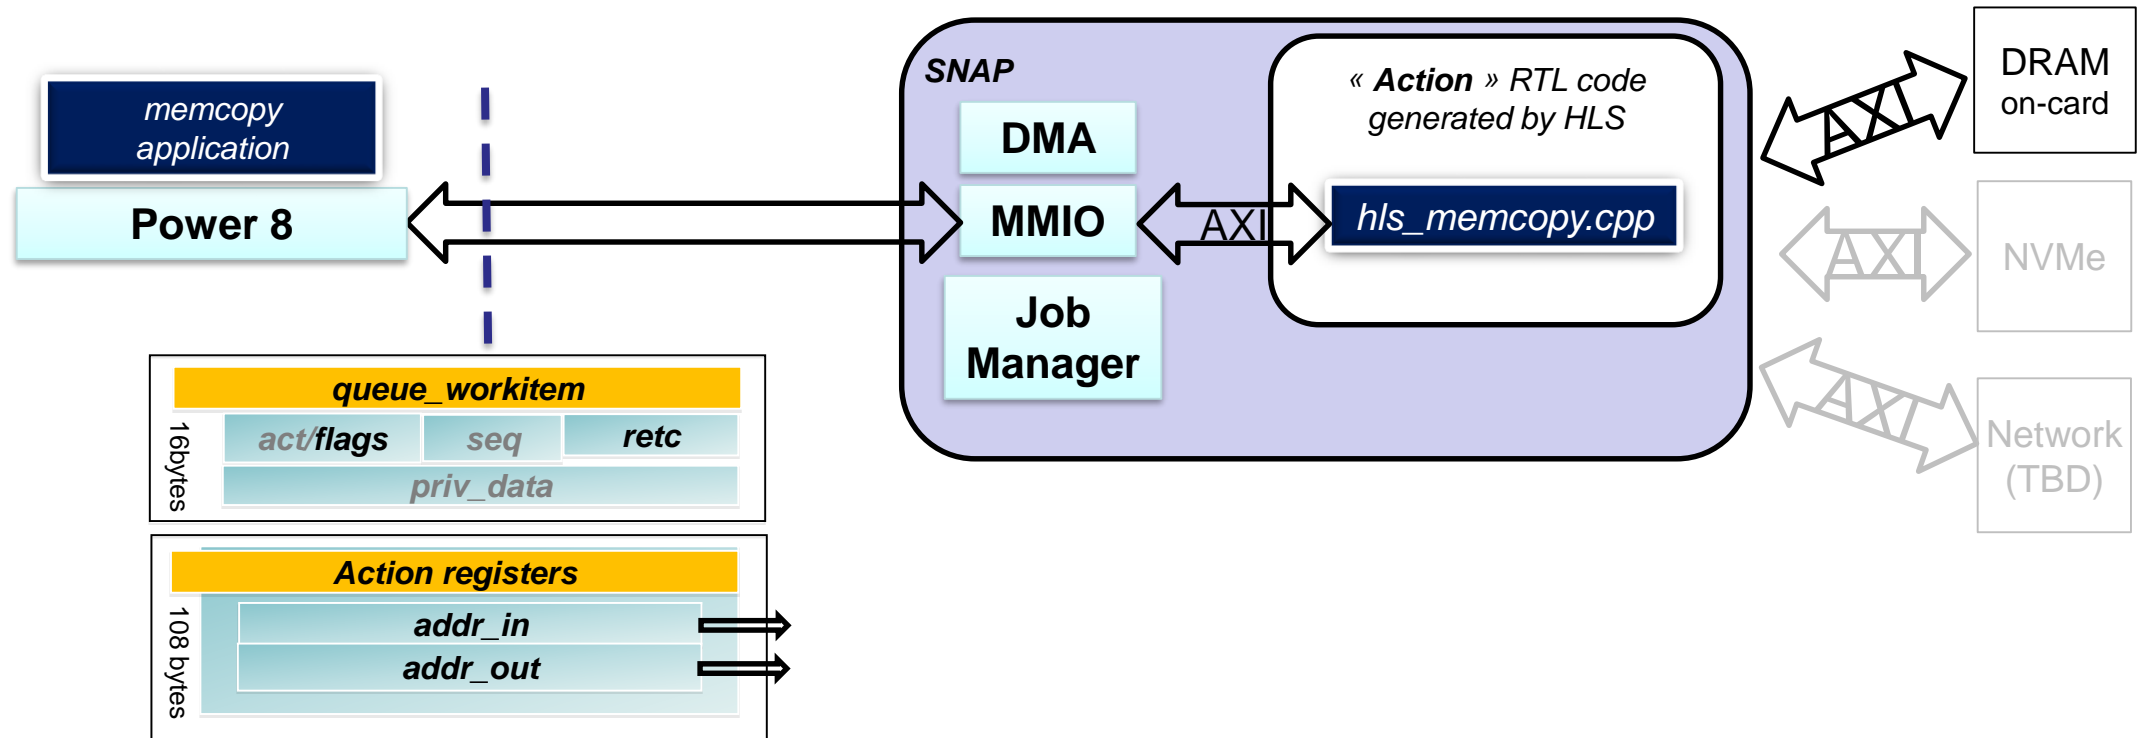

```
echo READ 512MB from DDR - one direction  
snap_memcpy -C0 -s0x2000_0000 -ACARD_DRAM -a0x0  
echo WRITE 512MB to DDR - one direction  
snap_memcpy -C0 -s0x2000_0000 -DCARD_DRAM -d0x0
```

```
Move 4KB from Host to DDR and back to Host and compare  
rm t2; dd if=/dev/urandom of=t1 bs=1K count=4  
snap_memcpy -i t1 -D CARD_DRAM -d 0x0  
snap_memcpy -o t2 -A CARD_DRAM -a 0x0 -s0x1000  
diff t1 t2
```

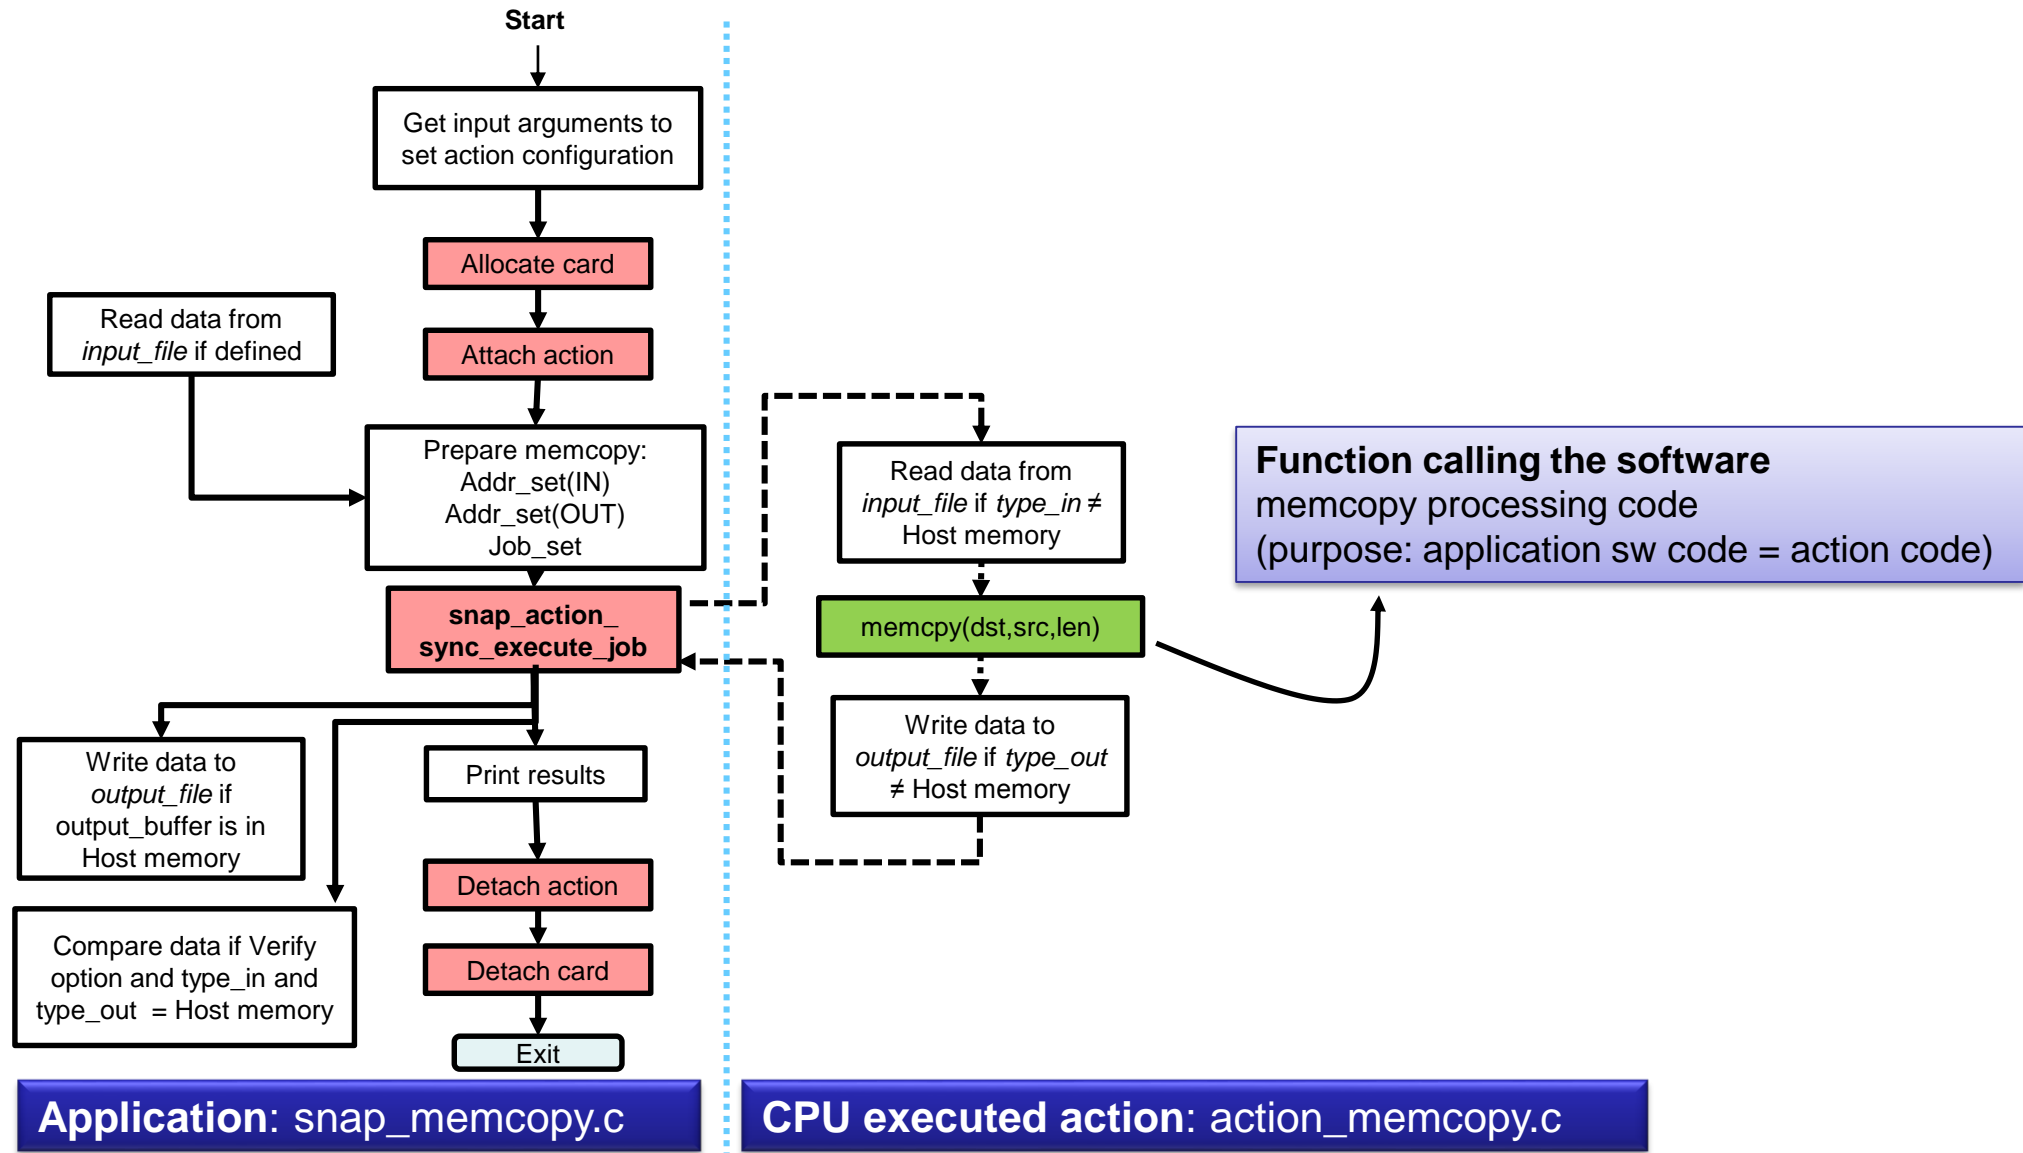

```
echo same test using polling instead of IRQ waiting for the result  
snap_memcpy -o t2 -A CARD_DRAM -a 0x0 -s0x1000 -N
```

Take in account that running on a simulator is far more slow than an execution on a FPGA:  
➔ moving 512MB with a simulator is a HUGE challenge. May be just trying 4K should be sufficient !

# memcpy registers

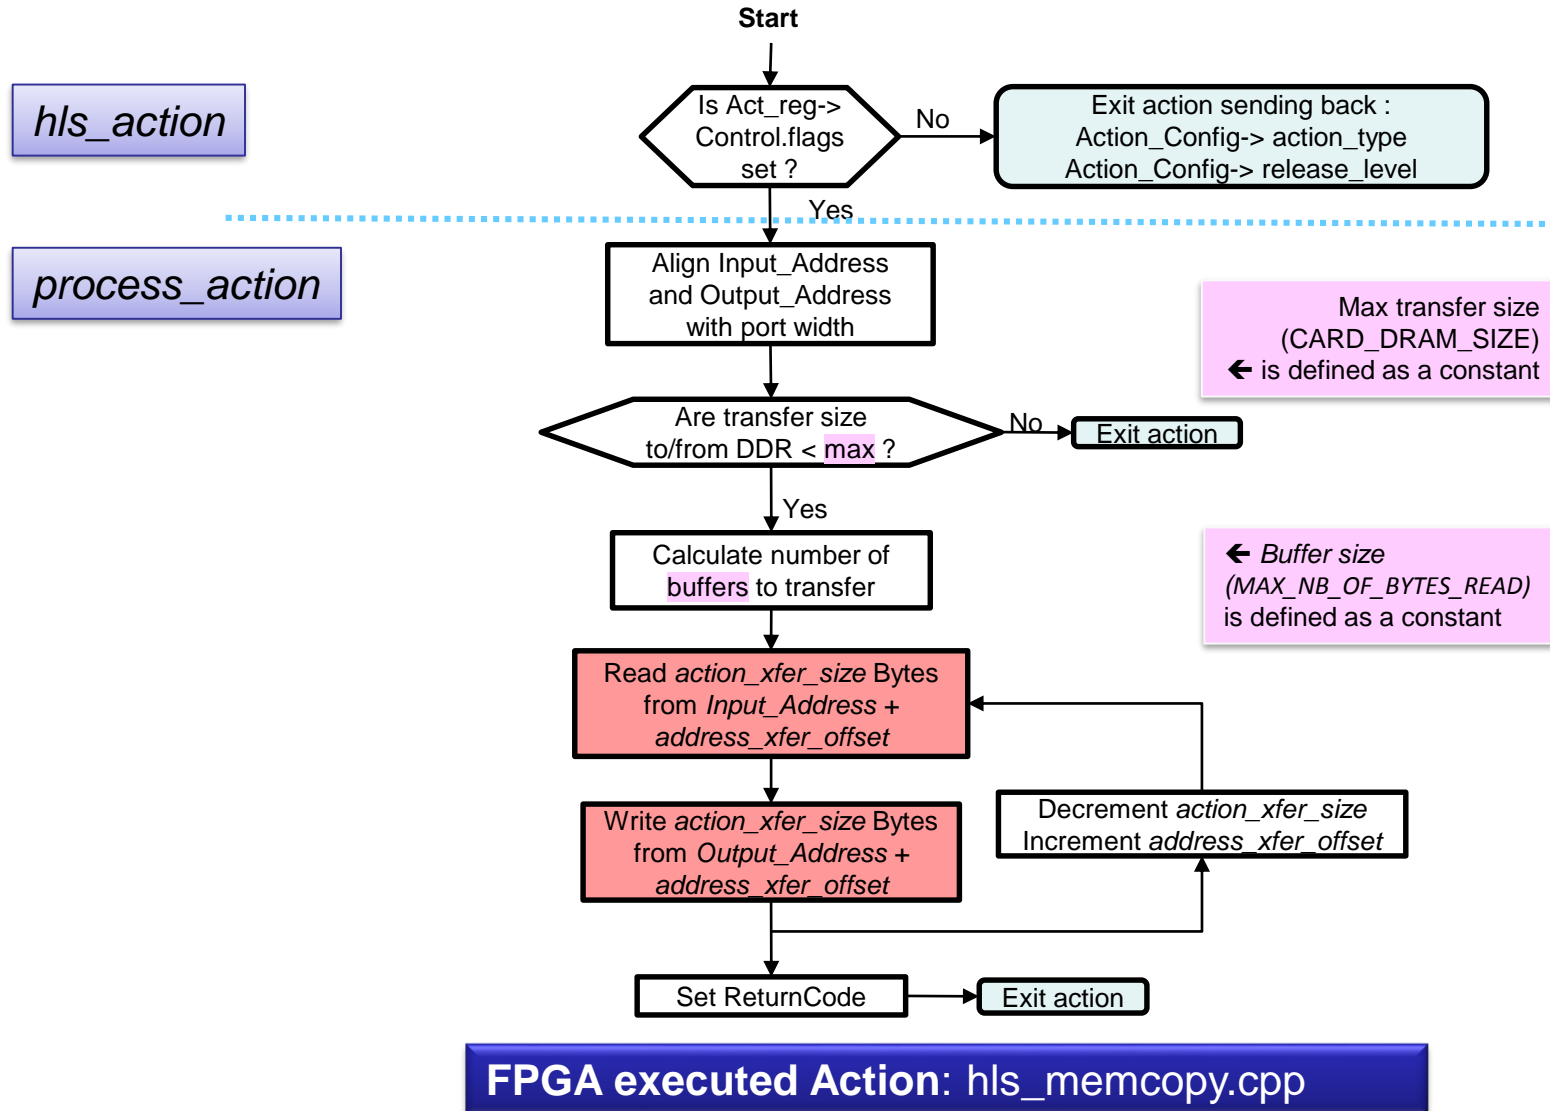

# Application Code + software action code : what's in it?

# Hardware action Code : what's in it?

Used during  
discovery phase only

# Constants - Ports

**Constants:** ➔ \$ACTION\_ROOT = snap/actions/hls\_memcopy

Constant name	Value	Type	Definition location	Usage
MEMCOPY_ACTION_TYPE	0x10141000	Fixed	\$ACTION_ROOT/include/action_memcopy.h	memcpy ID - list is in snap/ActionTypes.md
RELEASE_LEVEL	0x00000023	Variable	\$ACTION_ROOT/hw/hw_action_memcopy.H	release level – user defined
MAX_NB_OF_BYTES_READ	(256 * 1024)	Variable	\$ACTION_ROOT/hw/hw_action_memcopy.H	Max size in Bytes of the buffer for read/write access
MAX_NB_OF_WORDS_READ	(MAX_NB_OF_BYTES_READ/BPERDW)	Operation	\$ACTION_ROOT/hw/hw_action_memcopy.H	Max size in 64B words of the buffer for read/write access
CARD_DRAM_SIZE	(1 * 1024 * 1024 * 1024)	Variable	\$ACTION_ROOT/hw/hw_action_memcopy.H	Max size of the DDR - prevents from moving data with a size larger than this value

## Ports used:

Ports name	Description	Enabled
din_gmem	Host memory data bus input Addr : 64bits - Data : 512bits	Yes
dout_gmem	Host memory data bus output Addr : 64bits - Data : 512bits	Yes
d_ddrmem	DDR3 - DDR4 data bus in/out Addr : 33bits - Data : 512bits	Yes
nvme	NVMe data bus in/out Addr : 32bits - Data : 32bits	No (soon)

# MMIO Registers

Read and Write are considered from the application / software side

act_reg.Control		This header is initialized by the SNAP job manager. The action will update the Return code and read the flags value.								
CONTROL		If the flags value is 0, then action sends only the action_RO_config_reg value and exit the action, otherwise it will process the action								
Simu - WR	Write@	Read@	3	2	1	0	Typical Write value		Typical Read value	
0x3C40	0x100	0x180	sequence		flags	short action type	f001_01_00			
0x3C41	0x104	0x184	Retc (return code 0x102/0x104)				0		0x102 - 0x104	SUCCESS/FAILURE
0x3C42	0x108	0x188	Private Data				c0febabe			
0x3C43	0x10C	0x18C	Private Data				deadbeef			
action_reg.Data		Action specific - user defined - need to stay in 108 Bytes								
memcpy_job_t		This is the way for application and action to exchange information through this set of registers								
	Write@	Read@	3	2	1	0	Typical Write value		Typical Read value	
0x3C44	0x110	0x190	snap_addr.addr_in (LSB)							
0x3C45	0x114	0x194	snap_addr.addr_in (MSB)							
0x3C46	0x118	0x198	snap_addr.in.size							
0x3C47	0x11C	0x19C	snap.addr_in.flags (SRC, DST, ...)		snap.addr_in.type (HOST, DRAM, NVME,..)					
0x3C48	0x120	0x1A0	snap_addr.addr_out (LSB)							
0x3C49	0x124	0x1A4	snap_addr.addr_out (MSB)							
0x3C4A	0x128	0x1A8	snap.addr_out.size							
0x3C4B	0x12C	0x1AC	snap.addr_out.flags (SRC, DST, ...)		snap.addr_out.type (HOST, DRAM, NVME,..)					

\$ACTION\_ROOT/hw/action\_memcpy.H

```
typedef struct {
    CONTROL Control; /* 16 bytes */
    memcpy_job_t Data; /* 108 bytes */
    uint8_t padding[SNAP_HLS_JOBSIZE - sizeof(memcpy_job_t)];
} action_reg;
```

\$SNAP\_ROOT/actions/include/hls\_snap.H

```
typedef struct {
    snapu8_t sat; // short action type
    snapu8_t flags;
    snapu16_t seq;
    snapu32_t Retc;
    snapu64_t Reserved; // Priv_data
} CONTROL;
```

\$ACTION\_ROOT/include/action\_memcpy.h

```
typedef struct memcpy_job {
    struct snap_addr in; /* input data */
    struct snap_addr out; /* output data */
} memcpy_job_t;
```

\$SNAP\_ROOT/software/include/snap\_types.h

```
typedef struct snap_addr {
    uint64_t addr;
    uint32_t size;
    snap_addrtype_t type; /* DRAM, NVME, ... */
    snap_addrflag_t flags; /* SRC, DST, EXT, ... */
} snap_addr_t;
```

# Performances measurements

## Measurements on ADKU3 card

hls_memcopy / ADKU3 board	1-direction access			
256KBytes buffer - 64 access/burst	Read from Host	Write to Host	Read from DDR3	Write to DDR3
Bytes transfered	BW (GBps)	BW (GBps)	BW (GBps)	BW (GBps)
512MB memory area transfer	3.337	3.305	10.336	9.584

To run these performances, run the following:

```
snap_find_card -A ADKU3
1
snap_maint -vvv -C1

echo create a 512MB file ...wait...
dd if=/dev/urandom of=t1 bs=1M count=512

echo READ 512MB from Host
snap_memcopy -C1 -i t1

echo WRITE 512MB to Host
snap_memcopy -C1 -o t2 -s0x2000_0000

echo READ 512MB from DDR
snap_memcopy -C1 -s0x2000_0000 -ACARD_DRAM -a0x0

echo WRITE 512MB to DDR
snap_memcopy -C1 -s0x2000_0000 -DCARD_DRAM -d0x0
```

Latency to access DDR3 memory:

- Read : from HLS\_action request to data in HLS : 232ns
- Write : from HLS\_action request to data in DDR : 226ns

# Performances measurements

## Measurements on N250S card

hls_memcopy / N250S board	1-direction access			
256KBytes buffer - 64 access/burst	Read from Host	Write to Host	Read from DDR4	Write to DDR4
Bytes transfered	BW (GBps)	BW (GBps)	BW (GBps)	BW (GBps)
512MB memory area transfer	3.166	3.569	14.854	13.524

Latency to access DDR4 memory:

- Read : from HLS\_action request to data in HLS : 184ns
- Write : from HLS\_action request to data in DDR : 105ns

To run these performances, run the following:

```
snap_find_card -A N250S
0
snap_maint -vvv -C0

echo create a 512MB file ...wait...
dd if=/dev/urandom of=t1 bs=1M count=512

echo READ 512MB from Host
snap_memcopy -C0 -i t1

echo WRITE 512MB to Host
snap_memcopy -C0 -o t2 -s0x2000_0000

echo READ 512MB from DDR
snap_memcopy -C0 -s0x2000_0000 -ACARD_DRAM -a0x0

echo WRITE 512MB to DDR
snap_memcopy -C0 -s0x2000_0000 -DCARD_DRAM -d0x0
```

## *Path of improvements*

1. HLS memcpy function waits for the end of the request before starting a new one. Being able to parallelize reads with writes since both ports are independent would increase performance since the DMA is able to pipeline requests.

# *History of this document and of the action release level*

V2.0: initial document

V2.1: new files directory structure applied

V2.2: changes to have one direction access to get real performances

V2.3: simplification of paths thanks to new SNAP features - updates in documentation – Issue#320 circumvention removed
